MYNX INTELLIGENCE / JOSHUA HALE

Local operators.
A whole operating ecosystem.

Independent builder | California | Technical and hardware partnerships

I build local AI operators with context, memory and tools, plus the studios, applications and infrastructure around them. MYNX Intelligence presents that existing body of work together, while keeping its platforms distinct.

THE WORK

Agents and platforms: Nova World and the separate Homestead / Steward environment; MYNX personality and skill-profile lineage.
Production: Studio Brain, JAMS and media/game development workflows.
Apps and operations: public applications, usable demos, app supervision and self-operated server/tunnel infrastructure.

WATCH ONE REAL OPERATOR WORKFLOW

A recovered LocalNova operator recalls a saved instruction, uses an installed local model to generate a capability, and executes it on three actual project files. The counts and SHA-256 results are independently checked. Negative cases and fresh-process context/tool reload are also verified.

Supervised execution: Codex submits requests and supplies the reviewed file adapter. A naming failure is retained; one empty-input guard is corrected after testing. The recording shortens waits and identifies the scope. It is not an unattended whole-platform benchmark.

THE HARDWARE STORY

Joshua began on a 4 GB Acer Chromebook and built across Acer and Snapdragon Lenovo machines. The current recorded run uses a Lenovo 83N3, Snapdragon X X126100 / Qualcomm Oryon, with 15.6 GiB RAM. Earlier Acer history is Joshua's account; this is not a fresh 4 GB benchmark.

THE NEXT CONVERSATION

A focused technical review, evaluation-hardware discussion or scoped paid pilot. Select one workflow and acceptance criteria, then agree the evaluation and terms. Distribution or licensing starts with a defined component and rights review. No ecosystem-wide rights or outcomes are promised.
